Abstract

In this study, we investigate synchronization phenomena in weighted complex networks using chaotic circuit. The proposed chaotic circuits network has Scale-free distribution and the chaotic circuit are coupled by using distance information. Next, we focus on the role of hubs in the proposed network. By computer simulations, we observe that the synchronization rate between hubs is high regardless of the coupling strength.

1. Introduction

Synchronization phenomena can be observed everywhere in our life. For example, we can confirm metronome, flashing firefly lights, beating rhythm of the heart and so on. Especially, synchronization phenomena of oscillatory network are interesting. In addition, complex networks attract attention from various fields. The feature of networks is characterized by the degree distribution, the path length and the clustering coefficient. Complex networks of chaotic circuits have been studied.[1] However, as research on coupling strength and the hub has not progressed yet.

In this study, we investigate synchronization phenomena in weighted complex networks using chaotic circuits. In this circuit system, the chaotic circuits are coupled with the distance information. Furthermore, we study influence of hub to synchronization in complex network. We use a chaotic circuit called "Mori-sinnriki Circuit" as a node. In this study, we use weighted complex networks with two hubs.

In this simulation, we investigate two experiments using this circuit. First, we focus on the distance between hubs. The nodes other than hubs which are connected with fewer nodes. We fix the position of hubs. Furthermore, we create another new hub by increasing links of another node. We investigate the synchronization rate between the fixed hub and the new hub.

Second, we focus on a node which connect to the hub. We build a network model with two hubs which are connecting to different nodes. In this network, we can confirm effect of a node which connect to hubs. And we investigate the synchronization rate between the hubs.

By computer simulations, we observe that the synchronization rate between hubs is high regardless of the coupling strength.

2. Circuit model

The chaotic circuit model which called Mori-Sinriki chaos circuit is shown in Fig. 1. This circuit consists of one negative resister, two capacitors, one inductors and dual-directional three diodes. And this circuit equation is shown in Eq. (1).

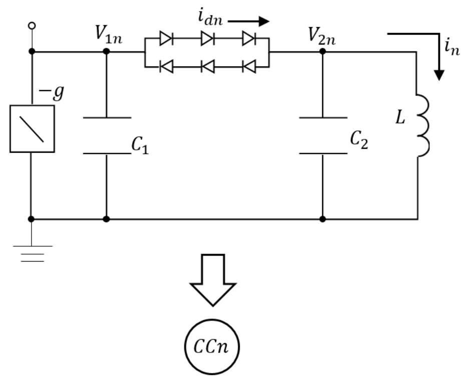

Figure 1: Circuit model.

$$\begin{cases} L\dfrac{di_1}{dt} = V_{2n}, \\ C_1\dfrac{dV_{1n}}{dt} = gV_{1n} - i_{dn}, \\ C_2\dfrac{dV_{2n}}{dt} = i_{dn} - i_n. \end{cases} \quad (1)$$

The characteristic of nonlinear resistance which consists of dual three diodes is following Eq. (2).

$$i_{dn} = \begin{cases} Gd(V_{1n} - V_{2n} - V) & (V_{1n} - V_{2n} > V), \\ 0, & (|V_{1n} - V_{2n}| < V), \\ Gd(V_{1n} - V_{2n} + V), & (V_{1n} - V_{2n} < -V). \end{cases} \quad (2)$$

By changing the variables and parameters Eq. (3),

$$\begin{cases} i_n = \sqrt{\frac{C_2}{L}} V x_n, \ V_{1n} = V y_n, \ V_{2n} = V z_n \\ t = \sqrt{LC_2}\tau, \ \alpha = \frac{C_2}{C_1}, \\ \beta = \sqrt{\frac{L}{C_2}} Gd, \ \gamma = \sqrt{\frac{L}{C_2}} g, \ \delta = \frac{1}{R}\sqrt{\frac{L}{C_2}}. \end{cases} \quad (3)$$

The normalized equation of this circuit is given as follows:

$$\begin{cases} \frac{dx}{d\tau} = z_n, \\ \frac{dy}{d\tau} = \alpha\gamma y_n - \alpha f(y_n - z_n), \\ \frac{dz}{d\tau} = f(y_n - z_n) - x_n. \end{cases} \quad (4)$$

where $f(y_n - z_n)$ is described as follows :

$$f(y_n - z_n) = \begin{cases} \beta(y_n - z_n - 1) & (y_n - z_n > 1), \\ 0, & (|y_n - z_n| < 1), \\ \beta(y_n - z_n + 1), & (y_n - z_n < -1). \end{cases} \quad (5)$$

3. System model

We investigate the synchronization rate using three networks based on original network. The original network model is shown in Fig. 2. The network is composed of 10 chaotic circuits and has Scale-free distribution. In this network, CC1 and CC2 are fixed hubs.

Figure 3 (a) to (c) show the networks obtained from the original network. Only Fig 3 (d) network is made by Fig 3 (c). First, Fig. 3 (a) shows the network that CC4 is added 4 links (connecting to CC3, CC5, CC6 and CC7). Namely, CC4 becomes new hub in this network. Similarly, Fig. 3 (b) shows the network that CC8 is added 4 links (connecting to CC2, CC3, CC4 and CC5). Namely, CC8 becomes new hub in this network. In Fig. 3 (c), two hubs connect to the different nodes. Also, the hub can connect only four nodes. If the original network remains, there are other hubs left behind, which may affect two hubs. Accordingly, we decrease other hub for focusing synchronization rate between hubs. In Fig. 3 (d), the network has twenty nodes. This networks was made to enhance hub nature from Fig 3 (c).

We compare the synchronization rate between nodes by changing the coupling strengths.

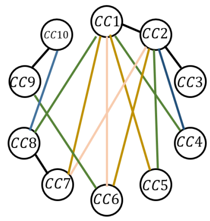

Figure 2: Original network model.

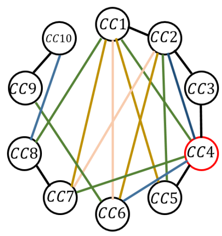
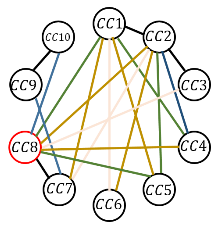
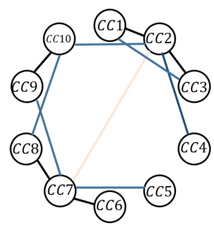


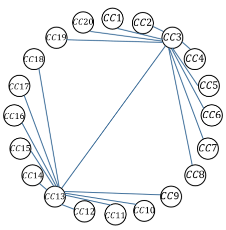
(a) Network with new hub:CC4.



(b) Network with new hub:CC8.



(c) Network with divide links.



(d) Network with increase nodes.

Figure 3: Proposed network.

The normalized circuit equation of these network models is given by the following equations.

$$\begin{cases} \frac{dx}{d\tau} = z_n, \\ \frac{dy}{d\tau} = \alpha\gamma y_n - \alpha f(y_n - z_n) - \alpha\delta \sum_{k \in S_n} (y_n - y_k), \\ \frac{dz}{d\tau} = f(y_n - z_n) - x_n. \end{cases} \quad (6)$$

The parameter δ corresponds the coupling strength between the circuits. And we set the parameter α = 0.500, β = 20.000 and γ = 0.500.

The coupling strength of each link is determined by the distance. The coupling strength becomes weaker as the length becomes longer. In Fig. 4, there are five kinds of the coupling strength. We define shortest links as a base length (coupling strength define 1.000). The coupling strength of other links is defined by the reciprocal of the ratio of length to base. An accurate value of the five kinds of the coupling strength is summarized in Table 1.

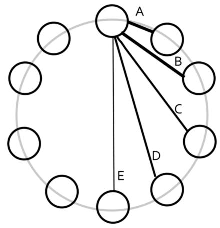


Figure 4: Coupling strength.

Table 1: Coupling strength.

	A	B	C	D	E
strength	1.000	0.5257	0.3826	0.3249	0.3090

4. Simulation results

Definition of synchronization in this study is determined a voltage waveform. We define synchronization as the following Eq. (7).

In the following figures, red line corresponds threshold which is given Eq. (7). It is determined that wave within a red line which is the threshold is synchronization. Also, we set the synchronization rate by calculating the ratio at all measured points.

$$|y_j - y_i| < 0.03 \qquad (i, j = 1, 2, \cdots, 10) \tag{7}$$

First, we consider a network model in Fig. 3 (a) and (b) and focus on CC1-CC2 to CC1-CC8. Fig. 5 shows CC1-CC4 and CC1-CC8 synchronization rate in the original network. In Fig. 6, CC1-CC4 synchronization rate is higher than CC1-CC3 when spite of coupling strength is lower. Similarly, in Fig. 7, CC1-CC8 synchronization rate is higher than CC1-CC4. These two synchronization rate is increased from the original network model.

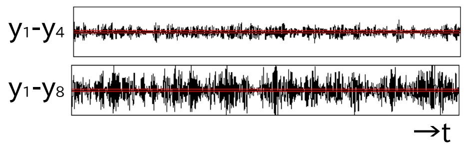

Figure 5: Different wave form in Fig. 2.

Table 2: Synchronization rate of Fig. 5.

Links	CC1-CC4	CC1-CC8
Synchronization rate	26%	18%

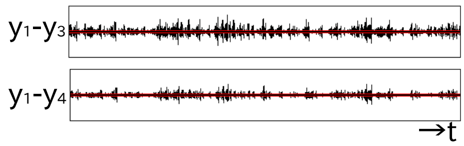

Figure 6: Different wave form in Fig. 3 (a).

Table 3: Synchronization rate of Fig. 6.

Links	CC1-CC3	CC1-CC4
Synchronization rate	32%	50%

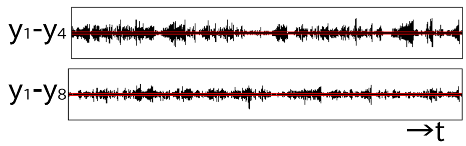

Figure 7: Different wave form in Fig. 3 (b).

Table 4: Synchronization rate of Fig. 7.

Links	CC1-CC4	CC1-CC8
Synchronization rate	26%	40%

We assume that synchronization rate between hubs is determined by not only the coupling strength unconditionally. We decrease the coupling strength between fixed and new hubs. In Fig. 8, we set the coupling strength of CC1-CC4 to 0. Similarly, in Fig. 9, we set the coupling strength of CC1-CC8 to 0. Although the coupling strength was set to 0, the synchronization rate decreases in Tables 5 and 6.

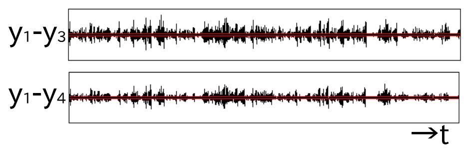

Figure 8: Different wave form in Fig. 3 (a).

Table 5: Synchronization rate of Fig. 8.

Links	CC1-CC3	CC1-CC4
Synchronization rate	29%	38%

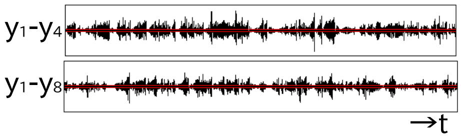

Figure 9: Different wave form in Fig. 3 (b).

Table 6: Synchronization rate of Fig. 9.

Links	CC1-CC4	CC1-CC8
Synchronization rate	24%	29%

Next, we split two hubs which links connect to divide nodes. In Fig. 3(c), we set CC2 and CC7 as the hubs. And we change the coupling strength between CC2-CC7. In Fig. 10, we compare in case of two coupling strength (δ=0.0 and 2.0). From this result, we can see that the synchronization rate between hubs has relationship with the connecting nodes.

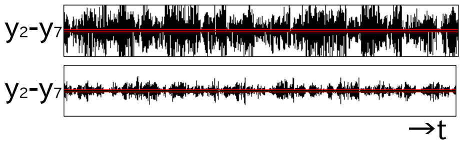

Figure 10: Different wave form in Fig. 3 (c).

Table 7: Synchronization rate of Fig. 10.

Coupling strength of CC2-CC7	0	2.0
Synchronization rate	6%	26%

Based on Fig 10, we study the synchronization rate when the property as a hub is stronger in Fig 3 (c). In Fig 3 (d), the network has twenty nodes. We set CC3 and CC13 as the hubs. Similarly to Fig 3 (c), we compare in case of two coupling strength (δ=2.0 and 0.0) in Fig 11. From this result, even if the network became a large network and the number of nodes increased, the same tendency was seen.

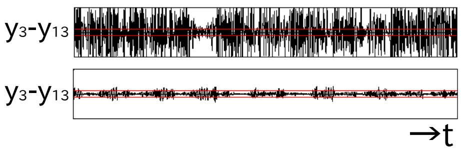

Figure 11: Different wave form in Fig. 3 (d).

Table 8: Synchronization rate of Fig. 11.

Coupling strength of CC3-CC13	0	2.0
Synchronization rate	17%	82%

5. Conclusions

In this study, we have investigated the influence of hub by using various networks changing hubs position. Also, we investigate about reasons which synchronization rate between hubs is higher in two methods. First, we change the coupling strength between hubs. Next, we split two hubs by divide connecting nodes.

In this result, the synchronization rate between the hubs is high regardless of the coupling strength. We tried to investigate reasons of high synchronization rate. We investigate in case of between hubs not connected to the same node. At this time, synchronization rate is proportional the coupling strength. We seem the coupling strength between hubs involved with the connected nodes. This is the same even if a large-scale network is used. However, the synchronization rate between hubs is high in large-scale network.

In our study, we use only five coupling strength value depending on the distance between chaotic circuits. Then, we need to use another type network and would like to investigate the synchronization rate by using the same methods. Furthermore, we should use large-scale networks inspired from real biological networks.
